Understanding Airport Technology

Airports are a complex and understandably highly regulated environment requiring specialist knowledge of the IT & telecoms systems and security solutions. It requires expertise that delivers innovative technology to ensure the security and smooth operation of the airport and the most enjoyable customer experience for millions of passengers from the point where they are planning their travel to the point of them making their journey and returning home.

Our team comprises individuals who are highly qualified with over 18 years of experience of successfully delivering IT & telecoms systems and security solutions, implementing complex and challenging projects and providing consultancy services to airports and other clients in the aviation industry. Our team members have previously held senior management positions in leading international airports in the UK, Heathrow and Gatwick Airport.

It has been seen just recently how an IT system failure can cause chaos and levels of disruption that can cost airlines millions in disruption and loss of business besides the long term reputation damage.

Our expertise in conjunction with the major service providers from our portfolio of partners provides flexibility to allow us to deliver a service which delivers you the exact IT & telecoms infrastructure and solutions to meet your business requirements in the most complex and highly regulated global organisations.

More than just IT solutions expertise

We understand that delivering you an IT solution is not just about delivering the best solution. It involves a long-term commitment delivering you a service including the necessary support and governance processes that are needed to ensure the solution is integrated into your business allowing you to deliver a leading and quality service to your customers.

IT Service Design and Technical Delivery

Managing mission critical real time 24x7 systems requires the design, integration and adherence to strict governance processes. The transition to BAU IT systems support is all too often missing or incomplete in a large percentage of new system deployments.

This includes updating legacy systems with necessary changes to ensure sustainability of adequate service levels.

Our team's experience in the use of best of breed tools and processes such as ITIL and service management, change and risk management we can underpin OLA/SLA's and 3rd party contracts in the most complex and challenging environments.
