

A Full range of managed cloud services and enterprise hosted application options, all designed to significantly reduce IT costs and management headaches.

Today's enterprises require new, smarter ways to optimize their mission-critical IT infrastructure. We can help you deploy innovative, yet proven, hybrid-cloud-based computing strategies.

We offer a rich portfolio of enterprise managed hosting solutions designed to optimize mission critical IT infrastructure performance and provide flexibility to meet current business needs and future demand. Our world-class hosting support enables rapid resource provisioning with additional hardware, middle ware, or application support to meet your IT requirements

Data regulation is one of the most significant factors in data handling and the General Data Protection Regulation due to come into force will require organizations to review their current strategies for compliance. Our portfolio of data storage solutions provides the management, visibility and security needed to satisfy compliance.

By allowing us to take care of your taxing daily distractions, you can optimize your workforce enabling them to focus on things that make a real difference to your business — while lowering costs, removing distractions and attaining superior service. The benefits are that you can:

- Deal with the big picture and focus on your business, not IT
- Provide relief to your overworked, understaffed organizations
- Follow best practices while avoiding cost surprises and risks

By utilizing Managed Services, you'll get practical, automated solutions for end users and your data center. By handing off your daily burdens, you'll gain greater control of your IT resources — a critical first step to aligning business and IT.

Application Services

Secure, resilient operation of enterprise applications is crucial to modern business. Maintaining the integrity of ERP applications and communications resources can be challenging and time-consuming, often restricting IT personnel from focusing on other projects with larger business implications. We offer application services designed to help simplify, streamline and secure enterprise applications across the organization and for an array of distinct business functions.

- Microsoft Exchange, SharePoint and Lync
- Managed Office 365 Productivity Suite
- Managed Oracle
- Managed Microsoft Dynamics
- Enterprise Mobility Management
- IBM Notes and Domino
- Custom Application Development

Cloud Desktop as a Service

DaaS makes everything easier

- Expanding your business
- Working Anywhere
- Keeping Data Safe / Compliance
- Simplifying BYOD
- Saving Money

DaaS with Accelerated Graphics

DaaS with accelerated graphics enables end-users with a Windows desktop instance in the Cloud, enhanced compute power and high-resolution graphics capabilities.

Managed Cloud Services and Enterprise Hosting

Managed DaaS

For many organizations, the intricacies to desktop virtualization are many and costly. To address this need, we offer Managed Services for DaaS.

Cloud Desktops

Enable end-users with a persistent Windows desktop instance in the Cloud, allowing for full-featured desktop capabilities.

Cloud Sessions

Cloud Sessions provides a cutting-edge, non-persistent virtual desktop experience in the Cloud, provisioning access at the desktop or the application level.

Cloud Infrastructure as a Service

Our Infrastructure-as-a-Service (IaaS) solutions can be delivered as a fully managed service or as a self-service platform. Both methods can help enterprises take advantage of the speed and flexibility of the Cloud, without sacrificing functionality.

Self-Service Cloud

Our Self-Service Cloud Services provide a comprehensive Infrastructure-as-a-Service (IaaS) platform designed to support simple, fast application building and scaling.

Managed Cloud

As a fully managed Infrastructure-as-a-Service (IaaS) platform, our Managed Cloud Services are designed to support applications with predetermined network demands, which require infrequent changes.

Cloud Onboarding and Migration

Our Self-Service Cloud combines the scalability and rapid provisioning of cloud computing with enterprise-class architectures, making it an ideal solution for deploying cloud-based applications and business models. The platform better positions organizations to decrease space, power and cooling expenses, while augmenting agility—all on a pay-as-you-go billing model.

When planning a cloud migration, the perceived complexity, alongside potentially tight deadlines and downtime concerns, can be daunting. We help ease the transition by building-in self-service onboarding resources and providing two optional, add-on onboarding services, which support expedited time-to-value and enhanced simplicity by allowing customers to engage with cloud migration experts.

Cloud Vault

Most enterprises have a continuous need to replicate production data due to security, testing, analytics or compliance demands. Cloud Vault is designed to solve these challenges by offering advanced, on-premises data protection and a replication target at highly available, Tier 3 data centers.

To accommodate the diverse storage and replication needs of modern enterprises, Cloud Vault customers have the on-site option of leveraging EMC's Data Domain or Actifio. Both Data Domain and Actifio seek to enhance backup, archiving and disaster recovery capabilities by providing high-speed, inline deduplication without increased burden on IT resources. Yet on-site, single-location data storage alone may not meet the compliance or business requirements of many enterprises today; many regulatory standards require contingent solutions for data resiliency.

Designed to provide enterprises with a secure, highly available, replication target, Cloud Vault is often a crucial addition to an enterprise data protection and replication strategy. Addressing growing storage and data replication requirements can often directly conflict with IT teams' need to restrain capital expenditure costs (CapEx). Cloud Vault's pay-as-you-go model can allow enterprises to mitigate CapEx increases in lieu of OpEx elements, while benefiting from a dependable, scalable storage and data replication solution.

Hosting Services

Through our premiere managed hosting provider, offering fully managed IT infrastructure and applications in highly secure traditional or cloud-enabled environments. Enterprise-class infrastructures require expert managed-hosting services that let your IT personnel focus on end-users and spend less time on upgrading, configuring and managing hardware, middleware and applications.

We offer a rich portfolio of enterprise managed hosting solutions designed to optimize mission critical IT infrastructure performance and provide flexibility to meet current business needs and future demand. Our world-class hosting support enables rapid resource provisioning with additional hardware, middleware, or application support to meet your IT requirements.

Reduce IT costs –

Mitigate capital investments and power consumption, as well as heating, cooling and real estate costs.

Improve Application Performance –

Respond rapidly to demands for increased scalability and reliability.

Managed Cloud Services and Enterprise Hosting

Maintain Close Control –

Managed hosting doesn't mean surrendering control over resources, bandwidth and hardware. We will work to keep you in control, while taking away the headaches.

Work More Efficiently –

Your IT organization can focus on strategic issues that move business forward, not staffing and IT infrastructure maintenance.

Managed Security

In conjunction with Alert Logic, a leading provider of Security-as-a-Service solutions for the cloud, offers simplified, dependable managed security solutions.

Managed Network

A team of IT experts oversees customer managed networks, allowing organizations to focus on critical business objectives.

Colocation

Scalable, enterprise-class colocation services at Tier-Two and Tier-Three data centers around the world. Take advantage of world-class networking, comprehensive security and professional monitoring.

Managed Server

Reliable, scalable physical server and VM management solutions can help keep your servers running at peak performance.

Managed Database

A comprehensive range of database administration services for leading DBMSs, such as Oracle, Microsoft SQL Server, and MySQL.

Managed Storage

Flexible, resilient storage solutions to help store, maintain, protect and recover information easily and cost-effectively.

Managed Application and Middleware Server

A team of experts who can help oversee server implementation, configuration, monitoring, maintenance and more for application/middleware servers hosted within our enterprise-class data centers.

Managed Web Server

Management services for web servers hosted within secure data centers can help relieve the burdens of web server implementation, configuration, maintenance, monitoring and more.
